## 1. General Description

This specification applies to the 42.2-inch Color TFT-LCD Module P420IVN02.1. This LCD module has a TFT active-matrix type liquid crystal panel 1920x480 pixels, and diagonal size of 42.2 inch. This module supports 1920x480 mode. Each pixel is divided into Red, Green and Blue sub-pixels or dots which are arranged in vertical stripes. Gray scale or the brightness of the sub-pixel color is determined with a 8-bit/10-bit gray scale signal for each dot.

P420IVN02.1 has been designed to apply the 8-bit/10-bit 2 channel LVDS interface method. The main feature of P420IVN02.1 would be high brightness, high contrast, wide viewing angle, high color saturation, symmetry narrow bezel, Edge LED backlight and high color depth. Special materials applied into this model are:

1. Liquid crystal: Advanced wide temperature LC(-40℃~110℃)
2. Polarizer: Wide temperature polarizer (95℃)

### \* General Information

Items	Specification	Unit	Note
Active Screen Size	42.2	inch	
Display Area	1039.68(H) x 259.92(V)	mm	
Outline Dimension	1067.48(H) x 287.72(V) x 27(D)	mm	D: front bezel to D/B cover
Driver Element	a-Si TFT active matrix		
Display Colors	8 bit /10 bit(8bit+FRC)	Colors	8 bit/10 bit selectable
Number of Pixels	1920x480	Pixel	
Pixel Pitch	0.54 (H) x 0.54 (W)	mm	
Pixel Arrangement	RGB vertical stripe		
Display Operation Mode	Normally Black		
Surface Treatment	Anti-Glare, 3H		Haze = 28%
Rotate Function	Unachievable		Note 1
Display Orientation	Portrait/Landscape Enabled		Note 2
Sunglasses Readability	Landscape Mode		Note 3
Operating Time	24/7		See Chapter 11.3 for details
Frame Rate	60	Hz	See Chapter 5.1 for details
LED MTTF	50K	hours	See Chapter 6.1 for details

**Note 1:**

Rotate Function refers to LCD display could be able to rotate. This function does not work in this model.

**Note 2:**

- (1) Landscape Mode: The default placement is T-Con Side on the Upper side, and the image is shown upright via viewing from the front.
- (2) Portrait Mode: The default placement is that T-Con side has to be placed on the right side via viewing from the front.

**Landscape (Front view)**

**Portrait (Front view)**

**Note 3:**

The image can be seen via polarized sunglasses while this panel is placed in landscape or portrait mode.

**Display Orientation:**

## 2. Absolute Maximum Ratings

The followings are maximum values which, if exceeded, may cause faulty operation or damage to the unit.

Item	Symbol	Min	Max	Unit	Conditions
Logic/LCD Drive Voltage	$V_{DD}$	-0.3	14	[Volt]	Note 1
Input Voltage of Signal	$V_{in}$	-0.3	4	[Volt]	Note 1
Operating Temperature	TOP	-20	+60	[°C]	Note 2
Operating Humidity	HOP	10	90	[%RH]	Note 2
Storage Temperature	TST	-20	+60	[°C]	Note 2
Storage Humidity	HST	10	90	[%RH]	Note 2
Panel Surface Temperature	PST		65	[°C]	

Note 1: Duration:50 msec.

Note 2 : Maximum Wet-Bulb should be 39°C and No condensation.

The relative humidity must not exceed 90% non-condensing at temperatures of 40 °C or less. At temperatures greater than 40°C, the wet bulb temperature must not exceed 39°C.

### 3. Optical Specification

Optical characteristics are determined after the unit has been 'ON' and stable for approximately 45 minutes in a dark environment at 25°C. The values specified are at an approximate distance 500 mm from the LCD surface at a viewing angle of  $\varphi$  and  $\theta$  equal to 0°.

Fig.1 presents additional information concerning the measurement equipment and method.

	y axis, up( $\varphi=90^\circ$ )	$\theta_u$	85	89	--	degree	
	y axis, down ( $\varphi=270^\circ$ )	$\theta_d$	85	89	--	degree	

Note:

1. Contrast Ratio (CR) is defined mathematically as:

$$\text{Contrast Ratio} = \frac{\text{Surface Luminance of } L_{\text{on5}}}{\text{Surface Luminance of } L_{\text{off5}}}$$

2. Surface luminance is luminance value at point 5 across the LCD surface 50cm from the surface with all pixels displaying white. From more information see FIG 2. LED current  $I_F$  = typical value (without driver board), LED input  $V_{\text{DDB}} = 24\text{V}$ ,  $I_{\text{DDB}}$  = Typical value (with driver board),  $L_{\text{WH}} = L_{\text{on5}}$  where  $L_{\text{on5}}$  is the luminance with all pixels displaying white at center 5 location.
3. The variation in surface luminance,  $\delta\text{WHITE}$  is defined (center of Screen) as:  

$$\delta\text{WHITE(9P)} = \frac{\text{Maximum}(L_{\text{on1}}, L_{\text{on2}}, \dots, L_{\text{on9}})}{\text{Minimum}(L_{\text{on1}}, L_{\text{on2}}, \dots, L_{\text{on9}})}$$
4. Response time  $T_\gamma$  is the average time required for display transition by switching the input signal for five luminance ratio (0%,25%,50%,75%,100% brightness matrix) and is based on Frame rate = 60Hz to optimize.

Measured Response Time		Target				
		0%	25%	50%	75%	100%
Start	0%		0% to 25%	0% to 50%	0% to 75%	0% to 100%
	25%	25% to 0%		25% to 50%	25% to 75%	25% to 100%
	50%	50% to 0%	50% to 25%		50% to 75%	50% to 100%
	75%	75% to 0%	75% to 25%	75% to 50%		75% to 100%
	100%	100% to 0%	100% to 25%	100% to 50%	100% to 75%	

$T_\gamma$  is determined by 10% to 90% brightness difference of rising or falling period. (As illustrated)

The response time is defined as the following figure and shall be measured by switching the input signal for "any level of gray(bright)" and "any level of gray(dark)".

**FIG. 2 Luminance**

5. Viewing angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which is normal to the LCD surface. For more information see FIG3.

**FIG.3 Viewing Angle**

## 4. Interface Specification

### 4.1 Input power

The P420IVN02.1 module requires power inputs which are employed to power the LCD electronics and to drive the TFT array and liquid crystal.

Item		Symbol	Min.	Typ.	Max	Unit	Note
Power Supply Input Voltage		$V_{DD}$	10.8	12	13.2	V	1
Power Supply Input Current	Black pattern	$I_{DD}$	-	0.309	0.371	A	2

	White pattern		-	6.192	7.430	Watt	
	H-strip pattern		-	4.884	5.861	Watt	
Inrush Current		$I_{RUSH}$	--	--	1.44	A	3

**Note1.** The ripple voltage should be fewer than 5% of  $V_{DD}$ .

**Note2.** Test Condition:

- (1)  $V_{DD} = 12.0V$ , (2)  $F_v = 60Hz$ , (3)  $F_{clk} = 74.25MHz$ , (4) Temperature = 25 °C  
(5) Power dissipation check pattern. (Only for power design)

## 5. Signal Timing Specification

This is the signal timing required at the input of the user connector. All of the interface signal timing should be satisfied with the following specifications for its proper operation.

### 5.1 Input Timing

#### 5.1.1. Timing table

**Timing Table (DE only Mode)**

Signal	Item	Symbol	Min.	Typ.	Max	Unit
Vertical Section	Period	Tv	500	585	860	Th
	Active	Tdisp (v)	480			
	Blanking	Tblk (v)	20	105	380	Th
Horizontal Section	Period	Th	1200	1282	1325	Tclk
	Active	Tdisp (h)	960			
	Blanking	Tblk (h)	240	322	365	Tclk
Clock	Frequency	Fclk=1/Tclk	42	45	48	MHz
Vertical Frequency	Frequency	Fv	47	60	63	Hz
Horizontal Frequency	Frequency	Fh	33.6	35.1	36.6	KHz

Notes:

(1) Display position is specific by the rise of DE signal only.

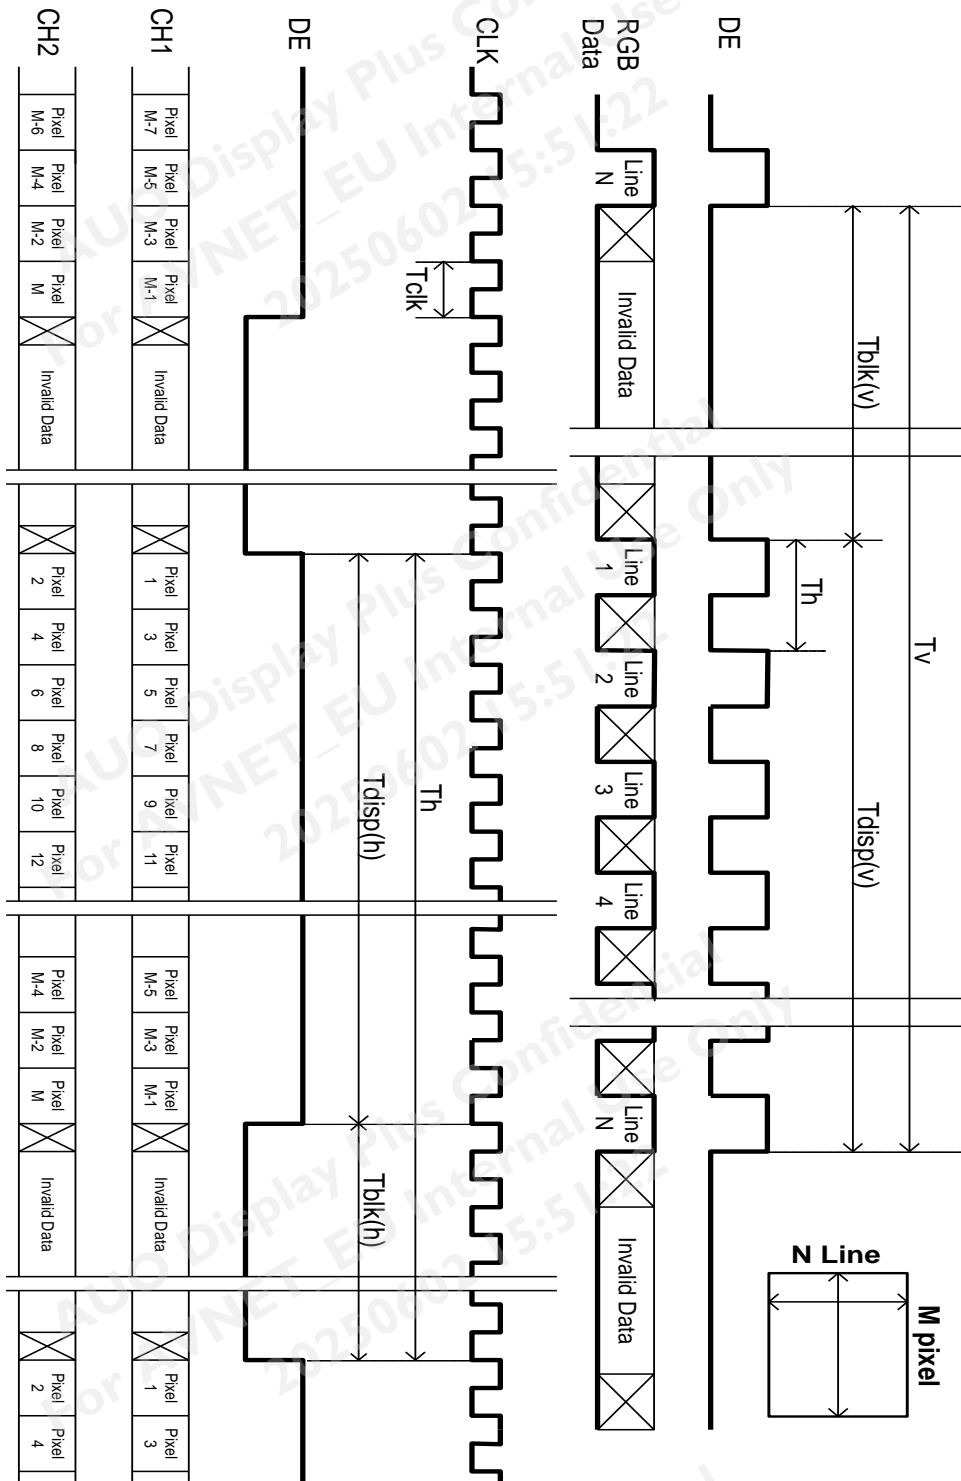

Horizontal display position is specified by the rising edge of 1<sup>st</sup> DCLK after the rise of 1<sup>st</sup> DE, is displayed on the left edge of the screen.

(2) Vertical display position is specified by the rise of DE after a "Low" level period equivalent to eight times of horizontal period. The 1<sup>st</sup> data corresponding to one horizontal line after the rise of 1<sup>st</sup> DE is displayed at the top line of screen.

(3) If a period of DE "High" is less than 1920 DCLK or less than 1080 lines, the rest of the screen displays black.

(4) The display position does not fit to the screen if a period of DE "High" and the effective data period do not synchronize with each other.

### 5.1.2. Signal Timing Waveform

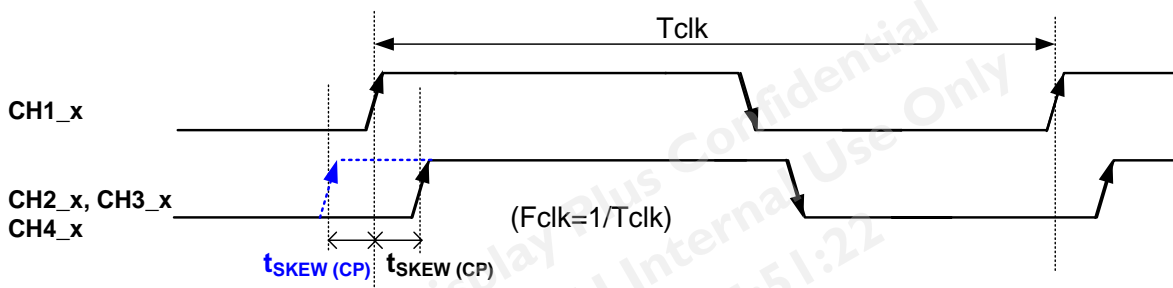

## 5.2 Input interface characteristics

Note:

- (1) t4=0 : concern for residual pattern before BLU turn off.
- (2) t6 : voltage of VDD must decay smoothly after power-off. (customer system decide this value)
- (3) t7 : When the power supply input voltage(VDD) is off, be sure to pull down the valid and invalid data to 0V
- (4) When user control signal is N.C. (no connection), opened in Transmitted end, t8 timing spec can be negligible.

## **11. Precautions**

Please pay attention to the followings when you use this TFT LCD module.

### **11.1. Mounting Precautions**

- (1) You must mount a module using holes arranged in four corners or four sides.
- (2) You should consider the mounting structure so that uneven force (ex. twisted stress) is not applied to module. And the case on which a module is mounted should have sufficient strength so that external force is not transmitted directly to the module.
- (3) Please attach the surface transparent protective plate to the surface in order to protect the polarizer. Transparent protective plate should have sufficient strength in order to resist external force.
- (4) You should adopt radiation structure to satisfy the temperature specification.
- (5) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter cause circuit broken by electro-chemical reaction.
- (6) Do not touch, push or rub the exposed polarizer with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment. Do not touch the surface of polarizer for bare hand or greasy cloth. (Some cosmetics are detrimental to the polarizer.)
- (7) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach front/ rear polarizer. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.
- (8) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.
- (9) Do not open the case because inside circuits do not have sufficient strength.

### **11.2. Operating Precautions**

- (1) The spike noise causes the mis-operation of circuits. It should be lower than following voltage:  
 $V = \pm 200\text{mV}$  (Over and under shoot voltage)
- (2) Response time depends on the temperature. (In lower temperature, it becomes longer.)
- (3) Brightness depends on the temperature. (In lower temperature, it may become lower.) And in lower temperature, response time (required time that brightness is stable after turned on) becomes longer.
- (4) Be careful for condensation at sudden temperature change. Condensation makes damage to polarizer or electrical contacted parts. And after fading condensation, smear or spot will occur.
- (5) When fixed patterns are displayed for a long time, remnant image is likely to occur.
- (6) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference shall be done by system manufacturers. Grounding and shielding methods may

be important to minimize the interface.

- (7) The conductive material and signal cables are kept away from LED driver inductor to prevent abnormal display, sound noise and temperature rising.

### 11.3. Operating Condition for Public Information Display

The device listed in the product specification is designed and manufactured for PID (Public Information Display) application. To optimize module's lifetime and function, below operating usages are required.

(1) Normal operating condition

- A. Operating temperature: -20~60℃
- B. Operating humidity: 10~90%
- C. Display pattern: dynamic pattern (Real display).

Note) Long-term static display would cause image sticking.

(2) Operation usage to protect against image sticking due to long-term static display.

- A. Suitable operating time: under 24 hours a day
- B. Liquid Crystal refresh time is required. Cycling display between 5 minutes' information (static) display and 10 seconds' moving image.
- C. Periodically change background and character (image) color.
- D. Avoid combination of background and character with large different luminance.

(3) Periodically adopt one of the following actions after long time display.

- A. Running the screen saver (motion picture or black pattern)
- B. Power off the system for a while

(4) LCD system is required to place in well-ventilated environment. Adapting active cooling system is highly recommended.

(5) Product reliability and functions are only guaranteed when the product is used under right operation usages. If product will be used in extreme conditions, such as high temperature/ humidity, display stationary patterns, or long operation time etc..., it is strongly recommended to contact ADP for filed application engineering advice. Otherwise, its reliability and function may not be guaranteed. Extreme conditions are commonly found at airports, transit stations, banks, stock market and controlling systems.

### 11.4. Electrostatic Discharge Control

Since a module is composed of electronic circuits, it is not strong to electrostatic discharge. Make certain that treatment persons are connected to ground through wristband etc. And don't touch interface pin directly.

### 11.5. Precautions for Strong Light Exposure

- (1) Strong light exposure causes degradation of polarizer and color filter.
- (2) To keep display function well as a digital signage application, especially the component of TFT is very sensitive to sunlight, it is necessary to set up blocking device protecting panel from radiation of ambient environment.

### 11.6. Storage

When storing modules as spares for a long time, the following precautions are necessary.

- (1) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5°C and 35°C at normal humidity.
- (2) The polarizer surface should not come in contact with any other object. It is recommended that they be stored in the container in which they were shipped.
- (3) Storage condition is guaranteed under packing conditions.
- (4) The phase transition of Liquid Crystal in the condition of the low or high storage temperature will be recovered when the LCD module returns to the normal condition.

### 11.7. Handling Precautions for Protection Film

- (1) The protection film is attached to the bezel with a small masking tape. When the protection film is peeled off, static electricity is generated between the film and polarizer. This should be peeled off slowly and carefully by people who are electrically grounded and with well ion-blown equipment or in such a condition, etc.
- (2) When the module with protection film attached is stored for a long time, sometimes there remains a very small amount of glue still on the bezel after the protection film is peeled off.
- (3) You can remove the glue easily. When the glue remains on the bezel or its vestige is recognized, please wipe them off with absorbent cotton waste or other soft material like chamois soaked with normal hexane.

### 11.8. Dust Resistance

- (1) ADP module dust tests are conducted with marked areas (e.g., holes and slits around the front bezel and back cover) sealed, to comply with JIS D0207 (see Figure 1).
- (2) To prevent particles from entering the module, please ensure the set has all the highlighted areas (holes and slits) adequately sealed or covered by set mechanism.
- (3) ADP's testing procedure cannot replicate all real-world operation scenarios. It is up to the module user to apply the most appropriate dust resistance solution for its particular application.
